Conversion of Group marks into individual marks

1. Each group report will be marked against the assessment criteria specified (see MOLE documentation for details) in order to generate a group mark.
2. Each student will then be asked to complete an anonymous WebPA peer assessment questionnaire. They will be asked to distribute a hypothetical pool of 100 beans or marbles between each of their group members, including themselves, according to a number of criteria including overall effort, enthusiasm, communication....).
3. Using this input, WebPA will generate a weighting factor for each group member, where a factor of 1 represents a contribution in line with other group members, > 1 indicates more contribution than average and <1 indicates lower than average. Note that the weighting factor represents **relative** contribution, not absolute levels of participation or intellectual input.
4. A **proportion** of the group mark (**NOT 100%**) will then be multiplied by his/her weighting factor to generate a final individual mark for each student.

For further information on how the WebPA scoring system works, please see:
